PROFESSIONAL SUMMARY —

Software Engineer with 4 years of experience in Python development, backend engineering, distributed systems, and database-driven applications. Experienced in designing scalable APIs, automating infrastructure workflows, and developing containerized applications using Docker, Kubernetes, and CI/CD practices. Strong expertise in Python, SQL, PostgreSQL, Git, and Linux-based environments. Currently building production-scale data engineering solutions using Apache Kafka, Apache Spark (PySpark), Hadoop HDFS, and Apache NiFi with focus on real-time data processing, ETL pipelines, stream analytics, and data lake architectures. Passionate about building scalable and reliable data platforms for enterprise systems.

TECHNICAL SKILLS

- **Languages:** Python, SQL
- **Big Data Technologies:** Apache Spark, PySpark, Hadoop HDFS, Apache Kafka, Apache NiFi
- **Data Engineering:** ETL Pipelines, Batch Processing, Stream Processing, Data Lake Architecture, Data Quality Validation, Data Warehousing Concepts
- **Databases:** PostgreSQL, Neo4j, Microsoft SQL Server
- **Frameworks & Libraries:** FastAPI, Pytest
- **Containerization & Orchestration:** Docker, Kubernetes
- **DevOps:** CI/CD Pipelines, Git, GitHub, GitLab
- **Tools:** Jira, Confluence
- **Networking:** YANG Models, NETCONF, Juniper Automation

EXPERIENCE

Software Engineer

BT E-Serve Pvt Ltd – Bengaluru, India

October 2022 – Present

- Designed and developed Python-based backend services and REST APIs for large-scale network configuration management systems.
- Built data processing workflows to capture, validate, transform, and persist network configuration data into PostgreSQL databases.
- Automated infrastructure configuration generation using YANG models, reducing manual operational effort and improving deployment consistency.
- Developed database synchronization mechanisms for handling dynamic configuration updates and maintaining data integrity.
- Integrated NETCONF-based telemetry and configuration data collection pipelines from network devices.
- Developed automation solutions using Python to process configuration datasets and improve operational efficiency.
- Implemented automated testing frameworks using Pytest and Behave, improving release quality and deployment reliability.
- Containerized backend applications using Docker and participated in CI/CD workflows for automated deployment and testing.
- Collaborated with cross-functional teams using Agile methodologies, GitLab, Jira, and Confluence to deliver enterprise-scale software solutions.

EDUCATION

Dayananda Sagar Academy of Technology and Management

2018-2022

Bachelor of Engineering in Mechanical Engineering

Jain College

2016-2018

Pre University

ASM High school

2015-2016

X

PROJECTS

Real-Time Customer Analytics and Fraud Detection Platform

- Designed and developed a production-style event-driven analytics platform using Apache Kafka, Apache Spark (PySpark), Hadoop HDFS, and Apache NiFi.
- Implemented Kafka producers and consumers for ingesting customer activity, payment, and order events in real time.
- Built Apache NiFi data flows for event ingestion, schema validation, routing, and data quality enforcement.
- Designed Bronze, Silver, and Gold data lake layers on Hadoop HDFS for raw, cleansed, and business-ready datasets.
- Developed PySpark batch and streaming jobs for customer analytics, fraud detection, and KPI generation.
- Implemented data validation and quarantine workflows to isolate invalid records and improve pipeline reliability.
- Utilized PostgreSQL for storing aggregated business metrics and reporting datasets.
- Containerized services using Docker and deployed workloads using Kubernetes.
- Implemented Git-based development workflows and CI/CD pipelines for automated testing and deployment.

Hackathon Finalist – AI Knowledge Assistant

- Collaborated in a 48-hour hackathon to design and deliver an AI-powered knowledge assistant using local Large Language Models (LLMs).
- Developed backend services for document ingestion, vector embedding generation, and Retrieval-Augmented Generation (RAG) workflows.
- Integrated Neo4j graph database for relationship-aware knowledge retrieval and contextual question answering.
- Containerized the solution using Docker and implemented a secure local inference architecture to prevent external data exposure.
- Delivered a functional end-to-end prototype within the hackathon timeline and demonstrated the solution to judges and stakeholders.
